Generics
Generics

Sometimes it is useful to parameterize a class with a type, $T$.

Rather than `IntContainer`, `LongContainer`, etc., we can just write `Container<T>`, and then create instances such as `Container<Integer>`.

We can also create generic methods that accept type parameters:

```java
static <T> void acceptSomeValue(T value) { ... }
```

Prior to the introduction of Java generics, programmers often used `Object` as a work-around as it can refer to any non-primitive type.
