Devops Specialists

About this Role

We are seeking to fill positions for both senior and junior specialists to join our Devops practice.

We realise Devops practice covers a pretty broad range to technical tools and skills, but we are looking for people with this sort of skills mix (to varying degrees of proficiency):

- Programming experience – we are not zealots, but we currently use Python, Freemarker, Javascript, Bash and Powershell
- Infrastructure-as-code experience – we currently support AWS and Azure via Cloud Formation, ARM/Bicep and Terraform
- CI/CD tooling – Jenkins, Azure Devops, Github Actions, CircleCI
- Cloud native architectures – serverless, PaaS – all the things that make the cloud a fun place to be
- Automation – we want computers to do the boring bits
- Operations – fixing things when they break and then incorporating what we have learnt into our platform, so it is less likely to happen again
- Certifications – we are an AWS partner so existing certifications would be great. Equally a willingness to undertake them works too

As we provide both cloud hosting and consulting services to clients as well as our internal software development teams, your time will be split between these activities.

As well as solid technical skills, this role will require good communication and the ability to fit into a highly professional culture. We often work with distributed teams and make extensive use of synchronous and asynchronous communication tools, as well as organising ourselves with digital agile delivery tools.

Many of our projects require a security clearance. If you don’t already have one, you must be eligible for one (i.e., you MUST be an Australian citizen so that we can sponsor your clearance).

You’ll be working on:

- fascinating and rewarding government projects in the domains of agriculture and biosecurity, trade and cargo, visa and traveller, renewable energy and population health
- High volume, high impact digital services

GoSource is based in Canberra but many of our team distributed with a combination of local and remote members. You will have the opportunity to work from home in your current location; in other words, you won’t need to relocate. This position is open to anyone living in any part of Australia with a decent internet connection.

About You

You have a passion and curiosity for all things automation and cloud, and are

- Comfortable working with modern tools in a continuous delivery environment.
- Pragmatic; you don’t tend to re-invent the wheel or let perfect be the enemy of the good.
• Empathetic to the team (including your future self) with good instincts for maintainability, supportability and other code qualities.
• Comfortable sharing your ideas with other bright and talented individuals. You achieve your best results working in a team.

You want to work in a young and exciting organisation that is diverse and agile, unconstrained by traditional structures and hierarchy.

You are keen to tackle the big problems of society in the age of digital transformation and seeking a rewarding and stimulating environment where similarly unique and talented individuals work together and flourish.

You might be fed up with the work-life balance offered by some large consulting firms and be seeking a job with more fun, better pay, and more flexible working arrangements.

You might want to live and work in one of Australia’s beautiful remote spots and so be a “virtual remote” team member with just occasional visits to Canberra.

About Us
GoSource design, build and manage digital services and applications. We are a digital native and agile organisation by nature, with a strong track record in delivering digital services that make a positive impact on Australian society.

We are fortunate enough to be somewhat choosy on the projects we undertake. They are all interesting and address important national and international concerns. They often include some cool tech like serverless, blockchain, verifiable credentials, offline first native apps, and so on.

Most of our projects are for the Federal Government – so we work in accordance with the Australian Government Digital Service Standard. In fact, many of us have worked directly in DTA/DTO and have experience transforming government from both the public and private sides.

What next
If this role sounds like it might be for you then get in contact - we need you now. If you have similar skills to those above, send us your CV anyway, we are always on the lookout for great people to join our team.

We like brief cover letters that help us get to know you, and please tell us why this opportunity attracted your attention.
